

Objective

A simple web search portal for [Star Wars](#) in ReactJS

Requirements

- Able to search in **two** or more of the following categories using the SWAPI
 - [films](#)
 - [people](#)
 - [planets](#)
 - [species](#)
 - [starships](#)
 - [vehicles](#)
- Search is done on **one** category at a time, no mixed results cross categories required
- UI needs to be responsive
- Search results should be displayed in an infinite scrolling or paginated view with only key information (feel free make your own judgement here)
- **Bonus:** able to view extended details of a search result (e.g. a certain person) via a separate view (e.g. a modal)

Guidelines

- Use [create-react-app](#) to bootstrap the project
- Use as much ES6/7 as you can
- Other open source libraries are allowed
- **Things we look for**
 - Code hygiene
 - Good documentation
 - Error handling
 - Reusability and testability (don't need to write tests for every single component though)
- No fancy styling is required, but look for good layouts and easy to extend styling architecture

Submission

- 48-hour take home exercise, use as much time as you want but general guideline is to spend no more than 4 hours on it
- A tarball/public GitHub repo of the runnable react application
